## Task 1 - Contextual Information and Learning Environment Factors

### A. General Contextual Information for Community, District, and School in Narrative

#### **Form** (limited to 1 page)

My community is in rural North Central Kansas. We are one of two schools in our county. The county population is 2,962 and the town population that the school resides in is 1,202. The average income for our area is \$46,196. Our persons in proverty rate is 12.7% which is an increase from the last census. The main industry in our community is farming. The biggest employer for our area is the County itself. Our county has two school districts but has two main towns that feed the school districts but five smaller towns that also feed into the school systems. Our school district has about 329 students and 164 are in the elementary school. Our school is a Title 1 school and we have about fifty-eight percent of our students are free and reduced lunches. Fourteen percent of our students have learning disabilities in our school district. Our school district has a Preschool building, kindergarten building, elementary school for first through fifth grade. Our final building is a sixth through fifth could have two teachers per grade to keep classes small. We average about twelve students per class with about twenty- four students per grade. The grade school is located on the out skirts of town on main highway. Our school has a bus system to bus students from surrounding towns and farms. They also have to bus students form the middle of town out to the high school.

**<u>B. Characteristics of Class</u>** (Use the following two tables to record information for the Whole

Class)

Table 1.1 Class Contextual Information (limited to 1 page)

| Age range of students10  | 0-11 Number of male s   | students4                        |

Must provide appropriate charts/graphs to display demographic data for district, school, and classroom in Appendix A.

**Table 1.2 Student Characteristics for Whole Class** (limited to 1 page for the entire section) Write about student characteristics that impact teaching in the classroom. Include curricular and extra-curricular interests, academic performance, class behavior, family/community background.

| Student Characteristics              | General Descriptions     | Implication for Teaching                            |
|--------------------------------------|--------------------------|---|
| Curricular and extra-curricular      | *4 boys and 10 girls     | Students like to talk even when not instructed. I   |
| interests Impacts on teaching in the |                          | will have to spend extra time explaining topics the |
| classroom                            | discuss topics and       | students are expected to already know. I need to    |
|                                      | *research information    | make sure I have manipulatives and hands on         |
|                                      | *enjoys technology.      | experiences for the students. I can provide         |
| Previously demonstrated academic     | *below standard science. | students with online videos and expose them to      |
| performance:                         | nands-on learning        | the real-world experiences.                         |
| % Above standard15%                  | Play recreation sports   |   |
| % Meets standard 50%                 |                          |   |
| % Below standard 35%                 |                          |   |

| Interpersonal in | eractions/behavior in  | Students like to talk to each other. Students are<br>supportive of each other. Most students have a<br>growth mindset. I have two students that have social<br>interaction issues in the classroom.  |   | I have to remind students several times of their voice level. Remind students of what is expect and approperete behavior for the activity.   |
|--|--|--|---|--|
| Family and/or community<br>background  |  | Over half of my class has parents that are still<br>together. Most students have parent support. A fourth<br>of the students are coming from farms. Some of my<br>students have parents that do not have any education<br>past high school |   | Limit homework because parents will not be able<br>to help the students. Send emails to parents<br>about what students need to have done for<br>projects so parents can help when they do have<br>time.  |
| C. Sub- Group/I<br>Table 1.3 Subgro  | Focus Student Inform<br>pup/Focus Student Ch   | nation<br>naracteristics   |   |  |
|  | Describe this subgroup/student and a rationale for why you selected them.  |  | What are the instructional implications?  |  |
| SUBGROUP<br>or<br>FOCUS<br>STUDENT   | The subgroup I have picked are three of my special<br>education students and one at -risk student. Two of the<br>students are very low in several subjects and are not at<br>fifth-grade instructional reading. One of my special<br>education students also has struggles to write for long<br>periods of time. Another student has some social<br>issues and has a hard time staying on task. The fourth<br>student really struggles in math and is very quiet and<br>does not engage in group discussions. All four of these<br>students are willing to work hard and sometimes will<br>not even tell you that they are struggling with an issue.<br>I need to make sure they are on task with the class. |  | When I have reading<br>or have someone re-<br>students several time<br>task. I also need to<br>that have their hand<br>sure my subgroup is<br>like to pair up with h<br>challenge the highe<br>questions so subgroup<br>there. I also need to<br>organized and struct<br>When we lots or wri<br>and printed off so the<br>instead of writing. | g material make sure it is at their instructional level<br>ad it to them. Make sure I am checking in with the<br>les that they are on task and understanding the<br>make sure I am not only calling on the students<br>raised to engage in the discussion, but to make<br>s also engaged by asking their thoughts. I would<br>igher students the lower students, so I can<br>r student to help explain and ask the right<br>oup students can learn when I can't always be<br>o make sure I pair my off- task student with a very<br>tured group so this student can stay on task.<br>ting to have some of the writing material typed up<br>the student can just tape or glue the material in |

## Task 2 - Instructional Design

### A. Description of Learning Objectives and Rationale for Selection (Minimum 2 learning

#### objectives, maximum 4)

Students will explain an atom is very small and cannot be seen and label the parts by end of lesson 4 by explaining to me how they know an atom is so small. Students need to understand everything is made up of atoms, however, it is very hard to understand since we cannot see atoms. Students will explore how small an atom really is and why they cannot see an atom. The students also need to understand all the parts that make this very small atom. Students will be able to graph a temperature change when mixing a substance and show the weight did not change by using water and Alka-Seltzer and explain to me the change in temperature. Students will understand when a chemical reaction occurs that the temperature changes. The students will be able to see this change when they see their data and then put in on a line graph to see the change. They also need to explain to me what happened to the temperature and why it changed. Students will be able to demonstrate they can identify materials based on their physical properties by naming at least three properties that make up that material. Students will be able to explain to use more than just one physical property to describe a material so because you can have many different materials. Students will be able to find the density and volume of an object by looking at a picture with dimensions or measurements stated 90% times by end of the unit. Students need to understand how to find the volume of a cube or regular prism when given the dimensions. This is also a math standard that we will cover in math so the students will have a good understand how to find the soncept when we get to this unit in math also.

**B.** Identify Learning Objectives: Focus should be on student performance – not activities.

What will students know or be able to do?

| Obj.<br>No. | Learning Objectives  | State Standard/Benchmark Met by Learning Objective   |
|-------------|--|--|
| 1           | Students will demonstrate an atom is very small and cannot be seen by<br>end of lesson 2 by explaining to me how they know an atom is so small<br>by drawing a picture or writing a small essay with 90% accuracy.                             | 5-PS1-1. Develop a model to describe that matter is made of particles too small to be seen   |
| 2           | Students will be able to graph a temperature change when mixing<br>a substance and show the weight did not change by using water<br>and Alka-Seltzer and explain to me the change in temperature<br>writing a short essay with a 90% accuracy. | 5-PS1-2. Measure and graph quantities to provide evidence<br>that regardless of the type of change that occurs when<br>heating, cooling, or mixing substances, the total weight of<br>matter is conserved. |

|         | Students will be able to analyze materials and list physical   |   |
|---------|--|---|
| 3       | properties by naming at least three properties that make up that   | 5-PS1-3. Make observations and measurements to identify   |
|         | material 90% from task cards around the room.  | materials based on their properties.  |
| 4       | Students will be able to find the density and volume of an object by looking at a picture with dimensions or measurements stated 90% times by end of the unit. | 5.MD.5b. Apply the formulas $V = l \cdot w \cdot H V = BB \cdot h$ (B represents the area of the base) for rectangular prisms to find volumes of right rectangular prisms with whole-number edge lengths in the context of solving real world and mathematical problems |
| C. Narı | rative: How do the unit objectives address these standards? (limited to 1 page   | ze)   |

We start by learning about what matter is and that is everything including air. Then we start into learning that matter is made of atoms. The students have several experiments, demonstrations and watch some videos to understand that an atom is very small, and you cannot see it. Next, we going to the parts of an atom and what an atom is made up of. The students get to make their own atom structure. Then finally we define the terms of an atom. Then we branch off into understanding that matter is not created or destroyed, and the student and I will do several experiments and demonstrations of this. They will also understand that in a chemical reaction that the atoms are just rearranged not destroyed. They will have an opportunity to graph their experiment findings. The students will complete an experiment that shows temperature change and they will graph it in their science notebook and on the computer. Student will also explain by typing why the temperature changed. Next students will explore the properties of matter. They will make a graphic organizer and look at several materials and explain the properties. We will explore volume and density which also connect to one of our math standards. The students will learn the formula for both and use the formula to find the volume and density of objects. The students will also learn how to find the volume of materials that are not rectangular prism or cubes by using water displacement. The students will finally learn at what point does an item sink or float.

D. Table 2.1 – Instructional Design: Overview of Unit Plan minimum 4 lessons, maximum 10.

| Lesson | Date   | Learning<br>Objective<br>(s) | Instructional Activities/Strategies  | Describe Specific Adaptations/Differentiation/Universal<br>Design for Learning (UDL) |
|--------|--------|------------------------------|--|--|
| 1      | 9/8/20 | Learning<br>Objective<br>1   | Students will try to blow a tissue ball through a bottle. Students will start a PowerPoint over Matter defining mass and atoms                               |  |
| 2      | 9/9/20 | Learning<br>objective<br>1   | Students will try to blow up a balloon in a bottle.<br>Students will cut paper as small as possible and<br>still see that an atom is still smaller than that |  |

| 3 | 9/15/20 | Learning<br>objective<br>1 | Students will organize a deck of cards in columns<br>and rows. Then the students will discuss how the<br>Parodic Table is organized. Students will build<br>atomic structures by picking out an element from<br>the periodic table   | My subgroup students, I worked with them to understand<br>what a good element for them would be to construct. I may<br>need to explain to them again the different parts of the<br>atom to help them figure out their atomic structure<br>Students will have the freedom of materials to build their<br>atomic structure. I will encourage the high students to<br>make more complex structures. |
|---|---------|----------------------------|--|--|
| 4 | 9/16/20 | Learning<br>objective<br>1 | Students will make a graphic organizer of the vocabulary words of matter. Once the students are finished, the students will do a "Hexagonal Thinking" task of how the words are connected  | I will have the definitions printed out for the one student in<br>my subgroup that has issues with writing for long periods of<br>time. Students will have the freedom to make the graphic<br>organizer their own by drawing pictures that helps them<br>remember the terms.<br>Students will explain their hexagonal thinking of how they<br>connected words with other students.               |
| 5 | 9/17/20 | Learning<br>objective<br>2 | We will several experiments for the students to<br>see that matter cannot be created or destroyed.<br>We will use a microwave popcorn, and students<br>will also get to see a candle burn all the way down<br>to see that candle was not destroyed but just<br>changed states. Students will do can experiment<br>with water and Alka-Seltzer in an open Ziplock<br>back and a closed Ziplock back to understand<br>open and closed systems. | I will group my students so the high students can help the<br>lower students be successful with the experiment. I will<br>also group my students so on task students can help the<br>non- on task students stay focused on our experiment<br>Students will write or draw the experiments and findings in<br>their science journals.  |
| 6 | 9/21/20 | Learning<br>objective<br>2 | I will do a class demonstration of making elephant<br>toothpaste, a chemical reaction. We will use the<br>slide show to see the chemistry behind the<br>experiment. We will also some YouTube<br>experiments that would be too dangerous for us to<br>do in our classroom to show the rearranging of<br>atoms.   |  |
| 7 | 9/23/20 | Learning<br>objective<br>2 | Students will use Alka-Seltzer and water to measure the temperature during the experiment.   | My subgroup I will give them the slides printed off for the<br>quiz so they can look back the questions or go at their own<br>speed if they need more time. My subgroup my use their   |

|    |         |                                  | Students will take a quiz of Part A of Matter that is fun and engaging through a PowerPoint.  | notebook if they need to find the answer. If a student<br>would rather have paper slides they may. I will go through<br>the slides on the projector this time so the students can<br>see how the "review game" works. We will take our time,<br>so everyone has a chance to answer the questions.<br>Students will graph the data in their science notebook, and<br>they will also put the data into the computer and have the<br>computer graph the data and explain to me the<br>temperature change and submit it through Google<br>Classroom.   |
|----|---------|----------------------------------|---|--|
| 8  | 9/28/20 | Learning<br>objective<br>3       | The students will have an introduction activity by<br>using prior knowledge and their senses to guess<br>items in brown bags. Students will use the Matter<br>PowerPoint and their journal to make a graphic<br>organizer of all the different physical properties of<br>matter.  | I will have a printed graphic organizer and words printed off<br>for my subgroup, so they do not have ton concrete on<br>writing all the words.  |
| 9  | 9/29/20 | Learning<br>objective<br>3 and 4 | Students will learn the different ways to fine<br>volume. They will use different objects in water in<br>a graduated cylinder. They will also be giving a<br>measurement of to a rectangular prism to find the<br>volume  | I will allow my subgroup to use a calculator when finding the volume of the rectangular prisms.  |
| 10 | 10/1/20 | Learning<br>Objective<br>4       | Students will learn how to find the density of an<br>object. They will use the information from their<br>water activities to find the density of their objects.<br>Students also work with a partner to find density<br>and volume objects from the PowerPoint slide.<br>Students will have a review quiz from a<br>PowerPoint of volume, density, and properties of<br>matter. | My subgroup will be able to use calculators to help with<br>multiplying numbers I can see if they understand how to<br>use the formula. I will also make sure my students are<br>paired with a partner that will help explain to them why they<br>are doing wrong and not just give the student the answers.<br>If a student does not want to take the quiz in a fun game<br>form, then they can have the questions on paper. This time<br>the students will take the quiz on their computer with<br>google slides and can move at their own pace. I will have<br>a copy of the questions for my subgroup so they can go<br>back to the questions when they need or if they have |

| How will technology be integrated within the unit? Explain candidate use and student use.   | Teacher: Computer for PowerPoints- teaching the material, Elmo for papers and charts- Showing items that I do not have in the PointPower so the students can see it better, Clicker to walk around the classroom Students: Google Classroom- for Quiz, Google Docs for making graphs and explain their finds, Elmo for displaying atom structures and hexagonal thinking cards  |

## Task 3 - Teaching and Learning

#### A. Narrative: Daily Teaching Reflections (limited to 2 pages total)

**Day 1:** The engage piece I had planned for the students was with "Generation Genus" however there were technology problems with the computer. We filled out KWL chart together. The student did not know anything about matter yet that they know of. However, I know they know somethings about solid, liquid, gases. So we went ahead and started into the PowerPoint slides. The students discussed matter and learned matter is anything that has mass and takes up space. They also discovered that air takes up space in a bottle and it is not empty along with air has weight and is made up of matter by doing a demonstration with a ballon. The students had lots of good discussions about matter. **Day 2:** The students really enjoyed today's experiment with using a ballon in a pop bottle. They really enoyed exploring different options to see if they could get the balloon to blow up in the bottle. Of course, when we add the water they really enjoyed this. However, this did not go quite as planned. It would be best if we had a sink to supply the water for the ballon instead of a water bottle because it is hard to get the balloon to fill up with water and it does not squirt up as much. The students were in awe of how small an atom was. They really enjoyed cutting the paper to get see how small an atom was.

**Day 3:** The students really enjoyed making the atomic structures. However, they had to go back and make them better several times. The students really struggled to understand the number of electrons and protons were the same number. We discussed several of the students' models and by the end of the class, they were starting to understand.

**Day 4:** The students were able to help define the vocabulary words since we have been working with the words for several days. The students were able to make some great pictures of what the words met to them also. I really enjoyed the hexagonal thinking activity so I could see if the students were understanding matter and the vocabulary words that go along with this unit. It also gave the students some good discussion where they thought certain words should go when there was no direct connecting word. Eighty percent of my class was able to label the parts of the atom. 100% of my students were able to explain to me in writing or a drawing that the atom so small that you can not see it.

**Day 5** The students are understanding that energy can not be created or destroyed. The microwave popcorn activity they really enjoyed and surprised some of them that the bag weighed about the same. The students understood that even though the candle melted that matter was still

there in form of a liquid and a gas. However, it did lose a little weight because of the steam coming out. We did have a good discussion about Atoms billions of years ago being us now. Some students struggled with this thought because of religion however, the class was very respectful of everyone's opinion. Next time I do this lesson I will be more prepared for this lesson, and explain we need to think about the science side of this topic. The students enjoyed seeing the closed open system of the Alka-Seltzer. Several did not think the close system would weigh any different, and they were surprised to see the results. The students were able to label open and closed systems.

**Day 6** The students really enjoyed see chemical reactions from youtube videos and making our elephant toothpaste. This has several of the student wanting to know if we could make the toothpaste foam up quicker with hotter water or colder water. So we tried it again with warmer water later on in the day and did not work as well. The students are understanding that matter is not created or destroyed but just the rearranging of atoms in a chemical reaction. We also touched on physical change with water and how water can go from a solid, to a liquid to a gas but does not change its atoms the just move faster or slower.

**Day 7:** The student really enjoyed getting to do an experiment today and interact with students again. The students were surprised to see the temperature go down when the Alka-Seltzer was added. The students were able to graph the data on a line graph. Some students have not had much experience with line graphs. We had to talk about using the lines and not spaces like they had in past years for bar graphs. We will need to continue to working making line graphs in future science experiments.

**Day 8:** The students used their five senses to try to figure out what is in a brown sack. The students did very well with this. As a whole class, most of the students got these right. However, next time I think it would better and harder for the students if I should boxes instead so they could not use their sense of touch as much and use the other senses more. Students made a graphic organizer of Properties of Matter. We also look at several properties of the different elements with our PowerPoint.

**Day 9:** Students learned the formula for volume and only about 50% of my student had prior knowelege of volume. Most students do well with finding volume, however some students struggled with their math facts, and using calculators allowed me to see they understand how to find the volume. The students have not had much experience reading from graduated cylinders so this created some issues in the students finding the volume displaced in water.

**Day 10:** Today the students built on the lesson from the volume and learned the formula for density. The students used the volume information of their object then the students weighted their object and find the density. Then students put their object in water to see if their calculation was right. They got to see if their object would sink or float. The students work with a partner to find the density and volume of several objects with a PowerPoint to review the math skills on finding volume and density.

B. Student Interaction and Engagement (Strategies for promoting student-to-student interaction and

student-to-teacher interaction) (limited to 1 page)

| Strategies for promoting student-to-student | Tissue paper in the bottle to see the air is already in the bottle, and a ballon in the bottle to see the air |
|---|---|
| interaction class demonstrations, student   | is already in the bottle. Building an atomic structure to understand an atom. Using a deck of cards to        |
| experiments youtube videos, engaging        | understand the periodic table. Using water and Alka-Suetzer to show an open and closed system, and            |
| PowerPoint with movements, using a clicke   | show the temperature of a chemical reaction of time. Youtube videos on matter and atoms, and                  |

| the slide show so I can,be walking an<br>room engaging quizzes from with                      | round the experiments that would be hard for us to in the classroom. When doing the PowerPoint I use a clicker can move around the Classroom. My PowerPoint has animations and items for the students to look for the student |
|---|--|
|   | throughout the PowerPoint to keep them interested.   |
| interaction   | the class, Class Demonstration of air has weight, Class Demonstration that matter can not be created destroyed, Class Demonstration on elephant toothpaste to show atoms are rearranged in a chemical reaction. Having a Quiz on a PowerPoint so I can activity walk around as the room, and see the   |
|   | students answer and the students feel comfortable because, it is a relaxing enviroment because   |
|   | it is not a pencil paper quiz.   |
| C. Analysis of Assessment (limit 1 pa   | age)   |
| Pre-Assessment:   |  |
| Description of results, based on pre-assessment chart (appendix C)                            | The range of the correct answer was 17-4 which was a 60% to 14%. The average score was 10 which is a 35%. The median score was 10.5. The students understood some of the simple mathetics of science. However, more complex math they did not get such as volume, density, and water displacement. Students were not able to draw and label an atom. Only 21% of the students were able to define matter.  |
| Describe how pre-assessment data<br>was used to proceed with<br>instruction for all students. | The students did not show they knew much about matter. We will review the terms and information several times to make sure they understand. We will also do lots of hands-on activities or demonstrations to help them understand matter.  |
| Formative Assessment:   |  |
| student performance results of formative assessment   | The students ranged from 90%-30%. The average score was a 72% and the median score was 75%. Students struggled with open ended questions. 70% of the students received a 100% on the multipichoice and true- false questions. This lets me know the students know the information they see it but they can not produce the information on their own yet. The second formative was not as good. The student range was 70%-20%. The average score was 36%.   |
| Discuss the results in reference to the learning objectives.                                  | 50% of the students were able to demonstrate that an atom is very small with getting a 100% of the questions correct and 79% of the class getting 80% correct or higher. Students are still working to understand chemical and physical changes. 70% of the students understand that matter can not be created or destroyed. The students did well with finding the volume with 11 of 13 students getting this right   |

|  | (one of the student did not take the quiz because they were gone for medical reasons). Students also did well finding what material is denser by looking at layered liquids. The students really struggled with reading graduated cylinder with a meniscus line. They also have a had time finding how much water is displaced even though we have done several demonstrations of this and talked about it several times. Only about 50% of the class knew the formula of density. Some of the other concepts the students missed are items we talked and discussed but are hard to understand and I wanted to see if they understand them yet and they do not. These topics are how much a cubic cementer of water weights and then applying that to a 10cmX 10cmX 10cm cube.  |
|--|---|
| Discuss any accommodations or<br>modifications based on the results<br>of formative assessments.                                   | My subgroup was allowed to use a science notebook for the formative assessment. However, three of the students still did not perform well on the assessment. We need to go over the different types of changes such as chemical and physical change. I allowed my subgroup to use their notebook for the formative assessment. We will be coming back and working on displaced water and work with students reading graduated cylinders.  |
| Summative (Post) Assessment:   |   |
| Description of results, based on<br>summative assessment chart<br>(appendix C)   | Most students improved. However, I have one student that missed a lot of classtime and she did not improve. She missed several demonstrations and group discussions. This student was a child in my subgroup that is not a special education student. Over half the students performed over the average summative score.  |
| How do the results demonstrate<br>meeting your learning objectives?<br>How do they demonstrate not<br>meeting learning objectives? | The students performed below average for all the objectives. The average test score was 62%. Some of my students did very well and some of them did not do well at all. I would like my average to be higher. Three students hit the 90% on the post-test. Then it dropped off quickly to 66%. Several students once again did not demonstrate they knew the information when it came to matching terms. The students did better in the multichoice section. Almost every student was able to label the atom and the one student that did not demonstrate it was very small. So even though the overall score does not show that they understand that concept I feel their drawings showed me that they did. Students did not seem to have remembered what happens with open and closed systems and this will be something we will need to review. Students are still struggling with remembering the formula for volume and density. This will be something we can go over this again in math class. |

**D. Visual Representation of Disaggregated Data (limited to 2 pages)** See Appendix C for data and graphs on the pre-assessment and summative assessment.

|   | Task 4 - Self-Evaluation and Reflection   | l   |   |
|---|---|---|---|
| 1 | A. Description of Successful Objectives (limited  | l to 1/2 pa   | age)  |
|   | Based on the analysis of all the assessment<br>results, identify your most successful<br>learning objective(s) from the unit.   | Explain<br>the succ   | why these objective(s) were successfully met. Give more than one reason for each of cesses identified.  |
|   | Objective 1: Students will demonstrate an<br>atom is very small and cannot be seen by end<br>of lesson 2 by explaining to me how they<br>know an atom is so small by drawing a picture<br>or writing a small essay with 90% accuracy.   | The stud<br>were as<br>down in<br>of the at<br>from my<br>it. | dents performed the 90% accuracy on their drawing or short essay. When students ked on the summative test what the smallest substance something could be broken to 86% of students got this right. The students were also able to demonstrate the parts tom and the one student that could not answered it was very small and this student was v subgroup. Students are able to understand an atom is very small and they can not see |
|   | Objective 2: Students will be able to analyze materials and list physical properties by naming at least three properties that make up that material 90% from task cards around the room.  | Student<br>90% or<br>formativ<br>Even the<br>object.          | s were able to list the three properties of a material very easily. Every student received higher on their task cards. Students were able to demonstrate on their summative and ve tests when an object floats or sinks with 76% of the students getting this concept. ough they can not calculate density they were able to use it as a property to explain the  |
|   | <b>B. Description of Least Successful Objectives</b> (  | limited to  | o 1/2 page)   |
|   | Based on the analysis of all the assessment res<br>identify your least successful learning objectiv<br>from the unit.   | ults,<br>ve(s)  | Explain why these objective(s) were not as successfully met. Give more than one reason for each of the least successful objectives identified.  |
|   | Objective 2: Students will be able to graph a temperature change when mixing a substance a show the weight did not change by using water a Alka-Seltzer and explain to me the change in temperature writing a short essay with a 90% ac | nd<br>and<br>curacy.  | Students were able to demonstrate at the time of the lesson that weight and<br>temperature change of closed and open system. When we did the formatives the<br>students understood what happens to the weight of and ope However, when it came<br>time for the summative student did not seem to remember in a closed system the<br>weight did not change.  |

| Objective 4: Students will be able to find the density<br>and volume of an object by looking at a picture with<br>dimensions or measurements stated 90% times by end<br>of the unit.  | The students can find the volume of a shape if the dimensions are listed. However, students are struggling to find the displaced volume. The students are still struggling to use the formula to find density. On the Summative and formative the students could not figure out to subtract the water differences. Only 43% of the students were able to figure this out.  |
|---|--|
| Discuss at least TWO things to do differently in the fut  | iture to improve students' performance. Be frank and thorough in your analysis.  |
| One thing I would do differently would make sure to have<br>wait on the scale to balance they will stay interested bette<br>of waiting on scales to balance out because that does a lo<br>having students work with finding measurements of gradu<br>feel this is hindering their process of finding water displace | a new scale. I think if the students could see the number moving and not have sit and<br>er. I wonder during some of the experience if I lost some of the students during the time<br>lot of time balance very time you change something. I feel I need to spend some time<br>luated cylinders and breakers. The students really struggle to read the measurement. I<br>cement because they have a hard time just reading the measurement. |
| C. Reflection on Unit and Implications for Teaching (lin  | imited to 1page)   |
| Based on the teaching of the unit, student performance<br>two detailed lessons, identify at least TWO aspects of ye<br>instruction that should be improved. Explain reasoning   | we, and<br>your<br>areas? Be specific.   |
| Aspect 1: The students lack knowledge of how to use scie<br>tools. Students struggle to read readings on graduated cy<br>Students struggle to make sure scale balances. Students<br>receive much science in form of experiments before they g<br>my class.  | When school starts and we are going over the basic information of science. I<br>will take the time to teach a mini- lesson on the different science tools and<br>equipment and how to use and read them. I will have the student explore<br>the items but weighing objects and filling up cylinders and telling<br>measurement. Also, go the other way and have the student fill the cylinder<br>up to a certain amount.                   |
| Aspect 2: I need to break my matter unit into more section students need more time with volume and open and close systems. These are the two areas they did not understand well on their summative test.  | ons. The<br>sed ind as I will have the students do more experiments and exploring with open and<br>closed systems. We need to do an extra day on finding the displacement of<br>water of an object. The students did an object of their own. However, I<br>would like to set up stations and task cards for the students to move around<br>the room and get more excercise on this topic.  |

- 7. What is density?
  - a. The mass of a substance plus its volume
  - b. The mass of a substance in a certain volume
  - c. The volume of a substance
  - d. A state of matter

8. Which is the volume of a rectangular prism with the dimensions of 6cm by 2cm by 4cm?

- a. 16 cm3
- b. 48 cm3
- c. 0 cm 3
- d. 10 cm3
- 9. Dale puts vinegar in a pop bottle and adds baking soda to the vinegar. (there is no balloon on top) What kind of system is this?
  - a. Closed
  - b. Open
  - c. Isolated

10. What is called when two or more molecules are joined into one particle?

- a. element
- b. molecule
- c. nucleus
- d. neutron

11. Kelly has a stack of 20 blocks. The mass of each block is 100 grams. What is the mass of the stack?

- a. 200 grams
- b. 80 grams
- c. 2,000 grams
- d. 120 grams

12. Kate puts 10ml of water in a bag. Then she adds an Alka-Seltzer tablet to the water then closes the lid. What will happen to the weight of the bag and the tablet?

- a. The weight will go down
- b. The weight will go up
- c. The weight will stay the same
- d. The weight will double

13. These bottles are....

- a. Half empty
- b. Half full
- c. Completely full
- d. Full of matter in the form of gas
